

StromPi 3 Firmware – Official Releases

- Firmware 1.0 – original Firmware Files
- Firmware 1.1 – Power Fail Warning
 - In the configuration terminal a new option has been included „warning-enable <option>“
 - If this option is enabled, a warning is sent through the serial interface, when the primary voltage source fails – this option is similar to the function „shutdown-enable“ where a warning is sent out to shutdown the Raspberry Pi
- Firmware 1.2 – PowerBack Detection
 - After a power failure of the primary voltage source the shutdown-time can now be canceled if in the configured shutdown-time the voltage-source turns back on. In this case there would be an additional message sent out the serial interface which can be processed in a python script for example – a modified serialShutdown.py script is added with this firmware update.
- Firmware 1.21 – Fix Shutdown Timer
 - Bug-Fix: Shutdown Timer can now be set > 255 seconds
